PHASE 4 DOCUMENT

ComicCraft: AI Comic Story Creator using Gemini Models

Phase Name: Comic Creation Interface and Story Editing Features

Project Name	ComicCraft: AI Comic Story Creator using Gemini Models
Phase	Phase 4 – Comic Interface and Story Editing
Project Type	Generative AI Comic Creation Application
Main Technology	Google Gemini Models
Prepared By	_____
Guide / Faculty	_____
Date	_____

Academic Project Phase Documentation

1. Phase Overview

This is Phase 4 of **ComicCraft: AI Comic Story Creator using Gemini Models**. After establishing secure Gemini-powered generation in Phase 3, this phase focuses on the creator-facing application experience. It implements the dashboard, comic-creation form, story settings, generated-story view, editing tools for characters and scenes, panel-script editing, and saved-project management.

2. Phase Objective

The objective of this phase is to give creators an intuitive workspace in which they can turn an idea into an editable comic script. The user interface should make it easy to provide story details, review generated material, customize every important element, save changes, and return to a comic project later. The system should keep the creator in control rather than treating AI output as a final result.

3. Creator Dashboard

The creator dashboard is the home screen after login. It provides actions such as Create New Comic, My Comic Projects, Recent Drafts, Templates, and Profile Settings. Each saved project can show a title, genre, last-updated date, generation status, and quick actions such as Open, Rename, Duplicate, Export, Archive, or Delete. The dashboard should help users quickly continue work without losing their previous drafts.

4. Create Comic Form

The Create Comic form collects the information needed to generate a useful first draft. Key fields include story idea, genre, tone, target audience, number of pages or panels, language, visual-style preference, and optional character notes. The form should clearly indicate required fields, offer example prompts, validate incomplete input, and display a progress indicator while the Gemini request is being processed.

5. Story Settings and Templates

Story settings give creators control over the generated result. A user can choose genres such as adventure, fantasy, mystery, comedy, science fiction, educational, or slice of life; tones such as humorous, dramatic, inspirational, or suspenseful; and lengths such as short strip, one-page comic, or multi-page comic script. Templates can offer starter structures, for example a three-panel joke, an educational explainer, a hero’s journey, or a mystery scene. Templates are optional starting points and remain editable.

6. Generated Story View

After Gemini returns the initial draft, ComicCraft displays the comic in organized sections: title, premise, character profiles, story outline, scenes, pages, panels, dialogue, narration, captions, and sound effects. The display should distinguish AI-generated content from user edits. It should provide actions to save the draft, regenerate a selected section, edit text, reorder scenes, and return to the dashboard.

7. Character Editor

The Character Editor allows the creator to modify character names, roles, appearance notes, personality traits, motivations, relationships, and dialogue style. The user can add or remove

characters as required. When a character is changed, ComicCraft can offer an optional regenerate action for only the relevant scenes or dialogue, avoiding the need to recreate the full story. Character consistency notes can be displayed to help keep descriptions stable across panels.

8. Scene Editor

The Scene Editor enables users to review the sequence of story events. A scene contains a location, time or context, participating characters, narrative purpose, and a short event description. Creators can edit scene text, add new scenes, remove scenes, or change the order. The editor should warn users when a change may affect later panels, while allowing them to decide whether to regenerate affected content.

9. Panel Script Editor

The Panel Script Editor is the main workspace for comic formatting. It organizes content by page and panel. Each panel can contain a panel number, visual description, camera or framing note, character actions, dialogue, narration, caption, and sound effect. Creators can edit each field, add or delete panels, move a panel within a page, and regenerate a single panel. This structure helps users convert a story idea into a production-ready comic script.

10. Version Saving and Draft Management

ComicCraft should save project changes through an explicit Save action and may provide optional auto-save with clear status information. Each significant revision can be stored as a draft version so that the creator can compare, restore, or continue from a previous version. The system should prevent accidental data loss by warning before deletion or navigation away from unsaved changes. Only the project owner can access or modify their private comic drafts by default.

11. Regeneration Controls

Regeneration should be targeted rather than destructive. A creator can request a new title, alternate premise, revised character, different scene, improved dialogue, or regenerated panel without losing the rest of the project. The user should be told what will be changed and should have the option to keep the earlier version. Prompts for regeneration should follow the project settings and preserve user-approved content wherever possible.

12. Responsive and Accessible Design

The ComicCraft interface should work on mobile phones, tablets, and desktop browsers. Forms should have clear labels, readable text, useful placeholders, and meaningful validation messages. Buttons should remain easy to tap on mobile screens. The workspace should use sufficient contrast, keyboard-accessible controls where practical, and a layout that allows lengthy comic scripts to be read and edited comfortably.

13. User Workflow

1. Creator logs in to ComicCraft.
2. Creator selects Create New Comic.
3. Creator completes the story idea and settings form.
4. The system requests a generated comic draft through the Gemini-enabled backend.
5. Creator reviews the title, characters, scenes, and panel script.

6. Creator edits characters, scenes, dialogue, captions, or panel descriptions.
7. Creator uses targeted regeneration for selected content when needed.
8. Creator saves a draft version.
9. Creator reopens the project later, continues editing, previews, or exports it.

14. Testing Plan

Testing should verify that dashboard actions open the correct pages, required comic-form fields are validated, generated content is displayed in the proper sections, edits are saved correctly, only authorized users can access a project, scene and panel reordering works, targeted regeneration does not overwrite unrelated content, draft versions are retained, deletion warnings appear, and the interface works on common mobile and desktop screen sizes. Error messages should remain clear if generation or saving fails.

15. Phase Deliverables

The Phase 4 deliverables are the creator dashboard, new-comic form, story settings and templates, generated-story view, character editor, scene editor, panel-script editor, project and version management, targeted regeneration controls, responsive interface design, and test evidence for core creator workflows.

16. Planned Next Phase

The next phase will be **Phase 5: Comic Preview, Export, and Enhanced Creative Tools**. It will add preview layouts, export options, formatting improvements, reusable templates, story refinement tools, and optional future-ready design for visual asset or image-generation integration.

17. Conclusion

Phase 4 turns ComicCraft's backend generation capability into an interactive creator workspace. Users can now begin with an idea, receive an AI-assisted comic draft, and refine it through detailed editing controls. The phase ensures that the creator retains ownership and control over the final comic script before preview and export features are added.
