Academic Project Phase Documentation

1. Phase Overview

This is Phase 5 of **ComicCraft: AI Comic Story Creator using Gemini Models**. This phase builds on the comic-creation and editing workspace developed in Phase 4. It adds comic preview modes, text-based export features, formatting controls, reusable creative templates, story-refinement tools, and a forward-looking design for optional visual asset or image-generation integration.

2. Phase Objective

The objective of this phase is to help creators review, refine, and share their completed comic scripts. ComicCraft should present a readable preview that resembles a comic production plan, allow users to export their work in useful formats, and provide guided creative tools for improving pace, dialogue, characters, and panel structure. The phase focuses on polished text-based comic output rather than claiming to generate final illustrated pages.

3. Comic Preview Module

The Comic Preview module converts the structured comic script into a clear reader-friendly layout. It can display the title, author or creator name, premise, character list, page sequence, panels, visual descriptions, dialogue, narration, captions, and sound effects. Users can switch between a screenplay-style view, a page-and-panel storyboard view, and a compact reading view. The preview helps a creator check story continuity before exporting or producing artwork.

4. Page and Panel Layout Preview

The page-and-panel preview organizes the comic by page number and panel order. Each panel card may show the panel number, visual direction, characters present, camera or framing note, dialogue balloons, narration, captions, and sound effects. The layout is a planning representation, not an illustrated final comic page. It allows creators to review pacing, identify panels with too much dialogue, and adjust the sequence before moving to drawing or external visual production.

5. Export Features

ComicCraft can provide export options for the creator’s text-based work. Supported formats may include plain text, Markdown, PDF, or a structured JSON file for future integration with other tools. An export can include the full comic script, story outline, character reference sheet, scene list, panel script, and creation metadata. The user should choose what is included, preview the export, and receive a clear confirmation after the file is prepared.

6. Export Workflow

1. Creator opens a saved comic project.
2. Creator reviews the comic using the preview mode.
3. Creator selects Export.
4. Creator chooses a format and the sections to include.
5. ComicCraft validates that the project has content to export.
6. The system prepares the selected output using the saved comic data.
7. Creator reviews the export summary and confirms.
8. The generated file is provided or saved according to the platform design.
9. The export activity may be recorded in the project history.

7. Story Refinement Tools

Story-refinement tools help users improve an existing draft without recreating it from the beginning. A creator can request a shorter or longer scene, stronger conflict, simpler language, more humorous dialogue, age-appropriate tone, a clearer ending, or a more consistent character voice. The system can offer rewrite suggestions for a selected scene or panel, while retaining the original version so the creator can compare and decide what to keep.

8. Dialogue and Caption Assistant

The Dialogue and Caption Assistant supports comic-specific writing. For a selected character or panel, it can suggest alternate dialogue, concise speech balloons, narration, captions, sound effects, or emotional expressions. Creators can choose a tone such as playful, dramatic, suspenseful, educational, or formal. The tool should encourage concise dialogue that fits a comic panel and should avoid automatically replacing user-written content without explicit confirmation.

9. Creative Templates and Prompts

Reusable templates help users start projects quickly. Examples include a three-panel comedy strip, superhero origin scene, mystery reveal, science-fiction encounter, classroom explainer comic, environmental-awareness story, historical scene, and fantasy adventure. Each template provides a starting structure, not a fixed result. Prompt suggestions can help users write clearer story ideas by asking for a main character, goal, conflict, setting, and desired ending.

10. Optional Visual Asset Integration Design

The core ComicCraft project focuses on story and panel-script generation. However, the architecture can prepare for a later visual-asset module. Such a module might support user-uploaded sketches, copyright-safe image libraries, or an approved image-generation service. If added, it must include clear consent, rights, content safety, prompt controls, and a distinction between AI-generated visuals and user-created artwork. The system should not falsely imply that text-only preview panels are finished illustrations.

11. Quality and Consistency Checks

Before preview or export, ComicCraft can run basic consistency checks. Examples include missing character names, empty panels, duplicated panel numbers, scenes without locations, dialogue with no speaker, incomplete page order, and unusually long text for a single panel. The system should show warnings as suggestions, not block creative choices unnecessarily. Users should be able to correct the identified issue or proceed deliberately when their story requires it.

12. Responsible Creative Use

Creators remain responsible for the final work they export or publish. They should review generated content for originality, accuracy, appropriate language, and suitability for the intended audience. ComicCraft should discourage plagiarism, copyright infringement, deceptive attribution, harmful stereotypes, and unauthorized imitation of protected characters or living artists. Exports should include an optional note that the work was created with AI-assisted drafting if the user or institution requires disclosure.

13. User Workflow

1. Creator completes or opens a comic script.
2. Creator selects a preview mode and reviews the page-and-panel sequence.
3. Creator uses refinement tools to improve selected scenes, dialogue, or captions.
4. Creator runs consistency checks and reviews suggestions.
5. Creator saves the revised draft.
6. Creator selects the required export format and content sections.
7. ComicCraft prepares the export.
8. Creator receives the completed file or export confirmation.
9. Creator can return later to make additional revisions and export a new version.

14. Testing Plan

Testing should confirm that all preview modes display project content correctly, panels appear in the right order, formatting remains readable on mobile and desktop screens, export selections produce the expected content, files are generated without corrupting saved drafts, project ownership is enforced, refinement tools affect only selected content, original versions can be retained, consistency warnings are understandable, and errors such as empty export or generation failure are handled gracefully.

15. Phase Deliverables

The deliverables of Phase 5 are the comic preview module, page-and-panel storyboard view, export workflow and supported output formats, story-refinement tools, dialogue and caption assistant, reusable templates, consistency checks, visual-integration design notes, responsible-use guidance, and test evidence for preview and export features.

16. Planned Next Phase

The next phase will be **Phase 6: User Management, Content Safety and Collaboration Features**. It will strengthen account management, content-policy controls, moderation workflow, privacy settings, optional sharing and collaboration design, and administrative oversight for ComicCraft.

17. Conclusion

Phase 5 enables creators to take an editable AI-assisted comic draft and turn it into a polished, reviewable, and shareable script. Preview, refinement, and export features improve creative control while preserving the distinction between story planning and final illustrated production. These tools prepare ComicCraft for stronger user management, safety, and collaboration capabilities in the next phase.
